Your business has a responsibility to put steps in place to protect not only its own information, but also the information of your employees, clients and service providers. Security is normally a two-pronged approach of both human and technical defenses. Do not be caught out with nothing in place.

Information Security

Today businesses are generating, storing and processing more information than ever before. The task of protecting that information is becoming increasingly more difficult. Threats are everywhere, both inside and outside of your organisation.

The security of your information is under increased threat from individuals both inside and outside of your organisation. To add to that complexity, some risks to your information are not even intentionally introduced. Without adequate controls and information security awareness, employees often unknowingly resort to habits which may introduce unexpected and unknown risks. These risks could result in your information becoming vulnerable.

Steps:

- You allow us to come through and assess your information systems setup.
- You describe your typical business processes.
- If you have any information security policy in place, we would incorporate that.
- We assess and make recommendations.
- We work with you to implement those recommendations.
